- KeyboardAvoidingView to avoid keyboard. Behaviour = 'Padding' means avoid using Padding.
- placeholder = { this.props.placeholder } we use this to reuse the component.
- height: null . This adapts Automatically.

## State

\* Store dynamic Values

\* automatically re-renders when the state value is updated.

## Callback Functions

\* A callback Function is a Function that is used as a prop from one component to another, and that another component can invoke the function if some event occurs.

→ State updated

\* Child Sends data to Parent Using the Callback

\* Superz (Props) . Here Superz is Used for Parent classes Constructor.

Const placeholder = this.props.placeholder

Const text = this.state.text

Const { placeholder } = this.props

Const { text } = this.state

↳ destructuring Props and state.

\* Allows you to pack properties of objects in a variable.

OnSubmit  $\rightarrow$  Callback Func  
(in the books code)
